

## Common Springboard error

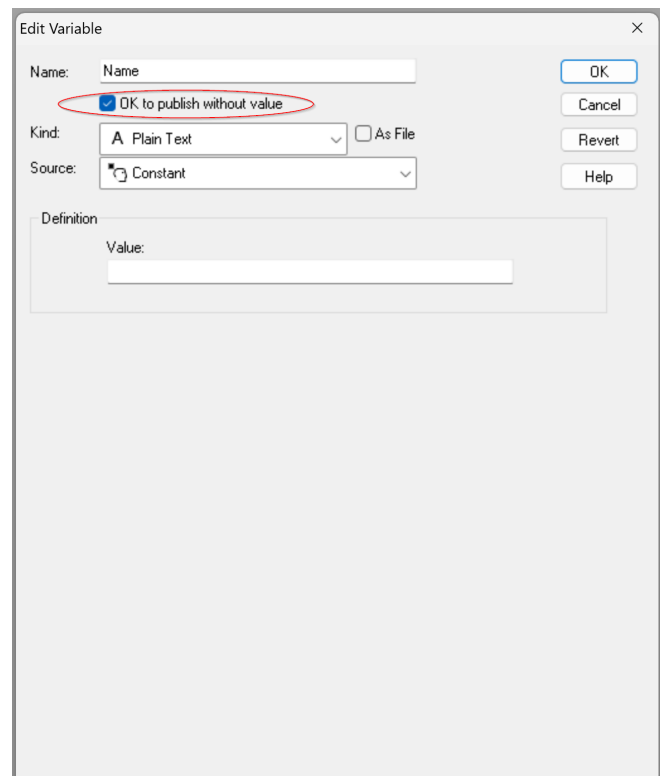

“Document 1 - No value for variable: [variable\_name], not OK to publish.”

If you are proofing your document and you come across an error similar to the one below, the fix is quite simple.

- J0000100: Document 1 - Starting document
- J0005000: Document 1 - No value for variable: Name, not OK to publish.
- J0005000: Job failed due to one or more critical errors
- J0000022: Job Status = FAILURE
- J0000012: Document creation finished, 0 document(s) created, 0 page(s) rendered
- J0000001: Transaction A1004832 ended

In pageflex, open the variable that is throwing the error. In this case, it is the “Name” variable.

Every variable that is created in Pageflex must have the “OK to publish without value” checkbox checked. If you are wanting to make a variable required, this must be done in the springboard. Check the checkbox and re-package the zip file. Re-upload the updated file to the springboard.

Edit Variable

Name:

☒ OK to publish without value

Kind:  ☐ As File
